

## Hands Free with the Panel Vise

The panel vise provides an excellent way to support your project perfectly upright while soldering corner joints, attaching hangers, or tinning edges. All while keeping your hands free and safe from hot surfaces.

To use:

- Remove the triangle wedge
- Stand your project upright alongside the straight edge of the vise base and continue to support until secured
- Slide triangle wedge in alongside panel until snug
  - Note: point of wedge may overhang the panel vise
- Tip: For added stability when using with large panels, secure the panel vise to your work surface with C-clamps.
- Note: Panels may often require gentle repositioning in order to get the support needed. The panel shown below at left is not securely supported. To properly support the panel, simply stand it fully upright and slide the wedge into position. The image at right shows a properly secured panel.

Other Uses:

Panel vise is also great for solder art jewelry, by removing the triangle wedge you are able to position your jewelry piece securing in place while you solder without the piece moving.
